

PROBLEM STATEMENT:

- **Connected and Autonomous Vehicles** (CAVs) depend on Vehicle to Vehicle(V2V) and Vehicle to Infrastructure (V2I) communication for safe, efficient transportation.
- These networks are vulnerable to **Sybil attacks** , **Sensor spoofing** ,**GPS spoofing** and many other attacks causing misinterpretation in V2V and V2I communication , unsafe routing and also accidents due to unsafe decision taken by CAVs during attack.
- Current security solutions lack real-time detection and monitoring, limiting the ability to respond promptly and thus there is a need for an **intelligent , real-time detection system** to handle this ensuring safe and secure transportation.
